# FDS Verification Cases

# A typical (ideal) workflow

# A typical (real-world) workflow

# The Firebot Family Tree

# Principles of continuous integration

- ✓ 1. Maintain a code repository
- ✓ 2. Automate the build
- ✓ 3. Make the build self-testing
- ✓ 4. Everyone commits to the baseline every day
- ✓ 5. Keep the build fast
- ✓ 6. Test in a clone of the production environment
- ✓ 7. Make it easy to get the latest deliverables
- ✓ 8. Everyone can see the results of the latest build

# Firebot Stages

Build Stage	Description
Stage 1	Obtain latest source code
Stages 2a-2b	Compile FDS (debug)
Stage 3	Run verification cases (debug)
Stages 4a-4b	Compile FDS (release)
Stage 5	Run verification cases (release)
Stages 6a-6e	Smokeview operations
Stages 7a-7c	Generate plots and statistics
Stage 8	Build manuals

[Firebot@blaze] Build success! Revision 20042 passed all build tests. Firebot x

# FDS Performance Statistics

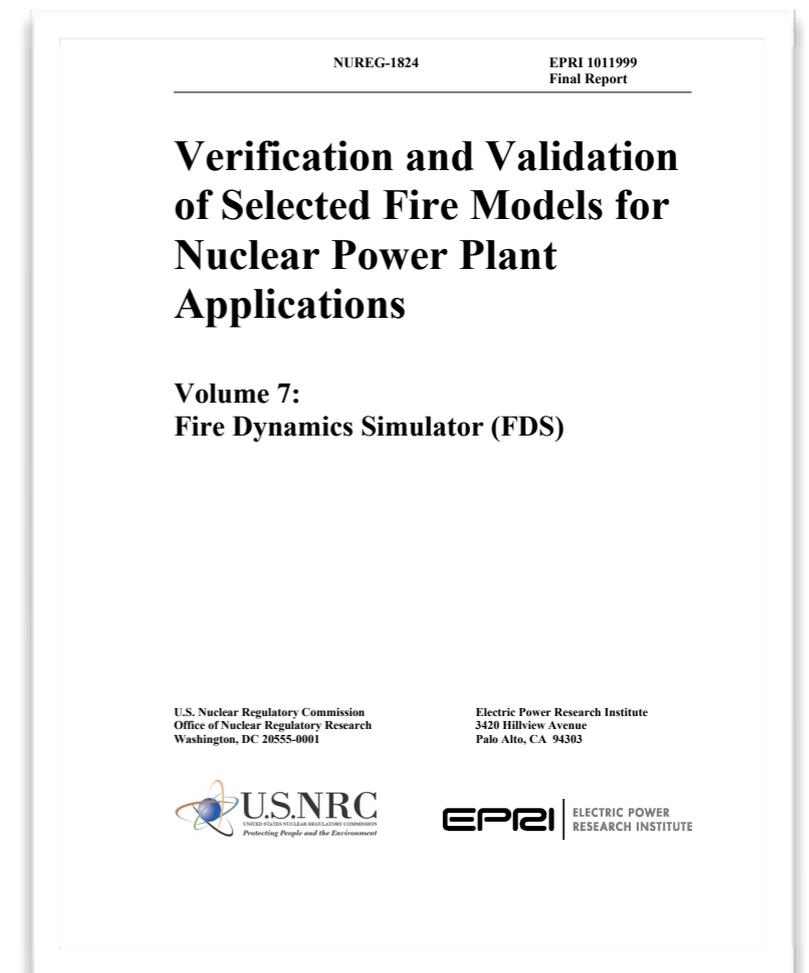

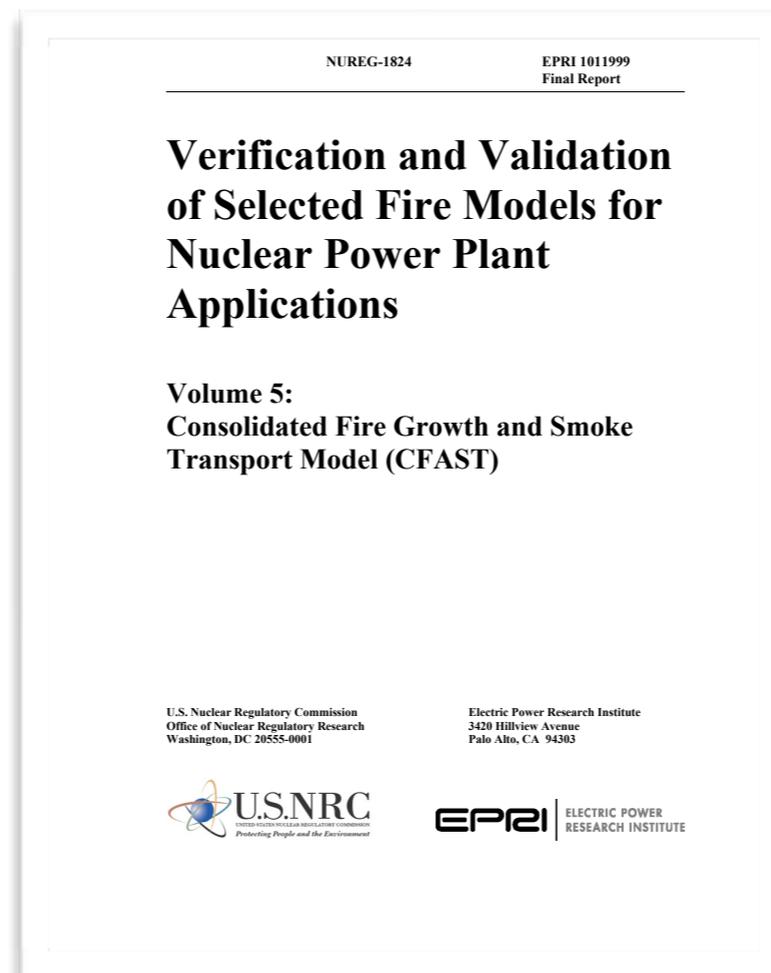

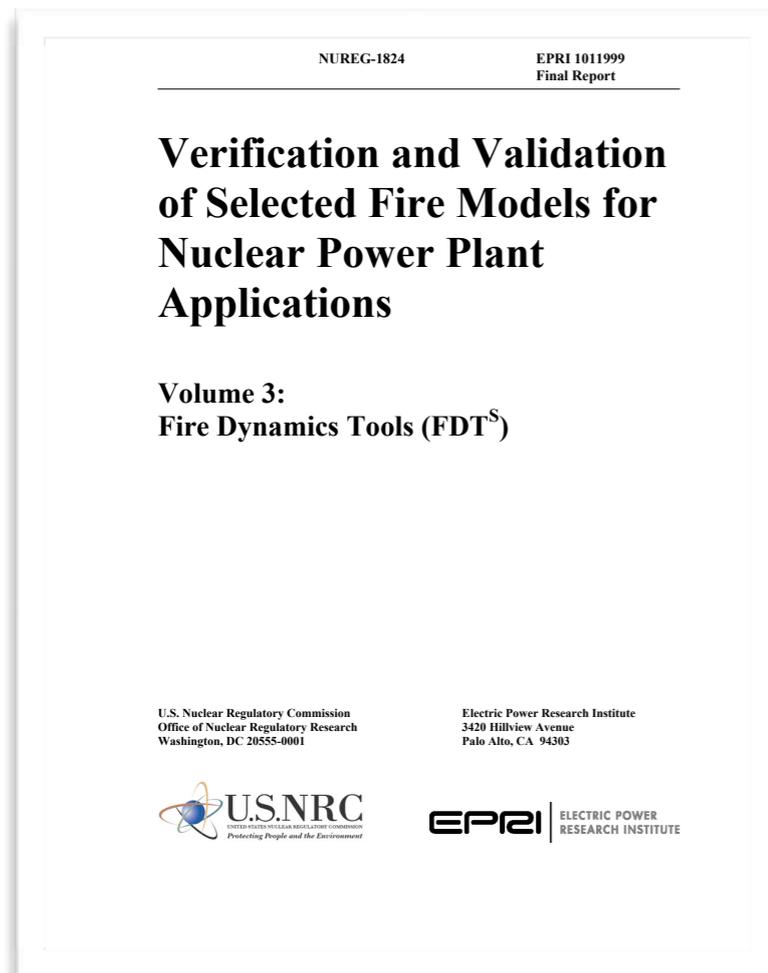

**Why automate the validation process?**

In 2007, the U.S. Nuclear Regulatory Commission (NRC), together with the Electric Power Research Institute (EPRI) and the National Institute of Standards and Technology (NIST), conducted a research project to verify and validate five fire models used for nuclear power plant (NPP) applications.

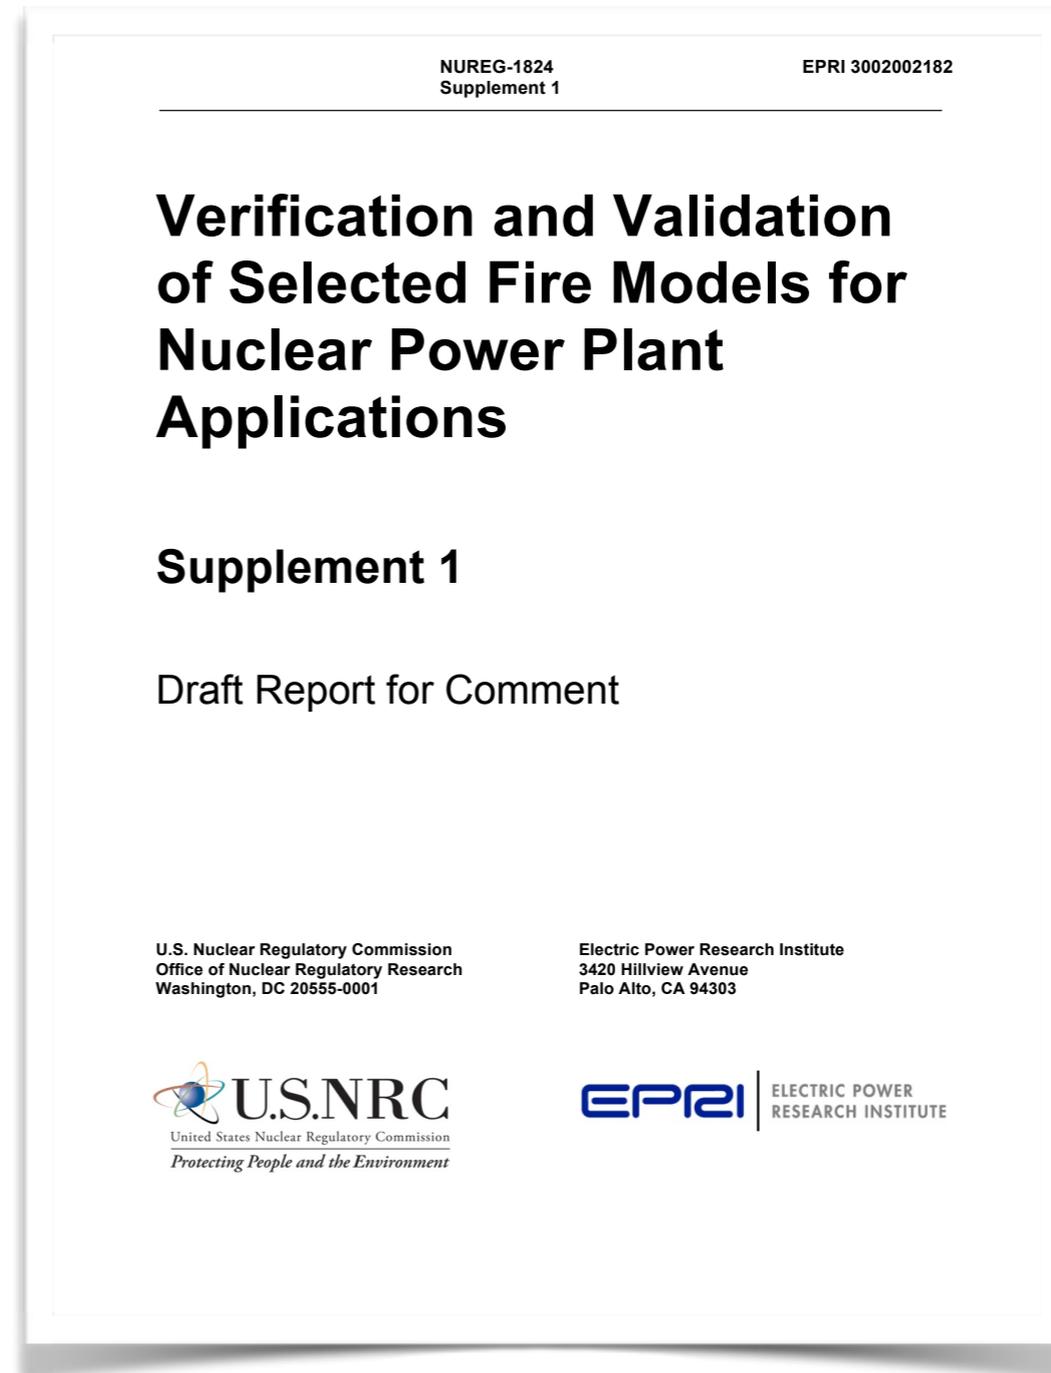

The results of this effort were documented in a seven-volume report, NRC NUREG-1824, Verification and Validation of Selected Fire Models for Nuclear Power Plant Applications.

Includes experimental data from 26 individual tests.

In 2014, the verification and validation study was expanded, and the full details of the revised V&V study are summarized in NUREG-1824 Supplement 1 (one volume).

- 860 individual experiments
- 44 experimental data sets
- 5000+ point-to-point comparisons
- Uses the latest versions of the models (FDS 6, CFAST 6)

A Correlation Guide (NIST SP 1169) was created to serve as a verification and validation guide for the empirical correlations to be consistent with the CFAST and FDS V&V guides.

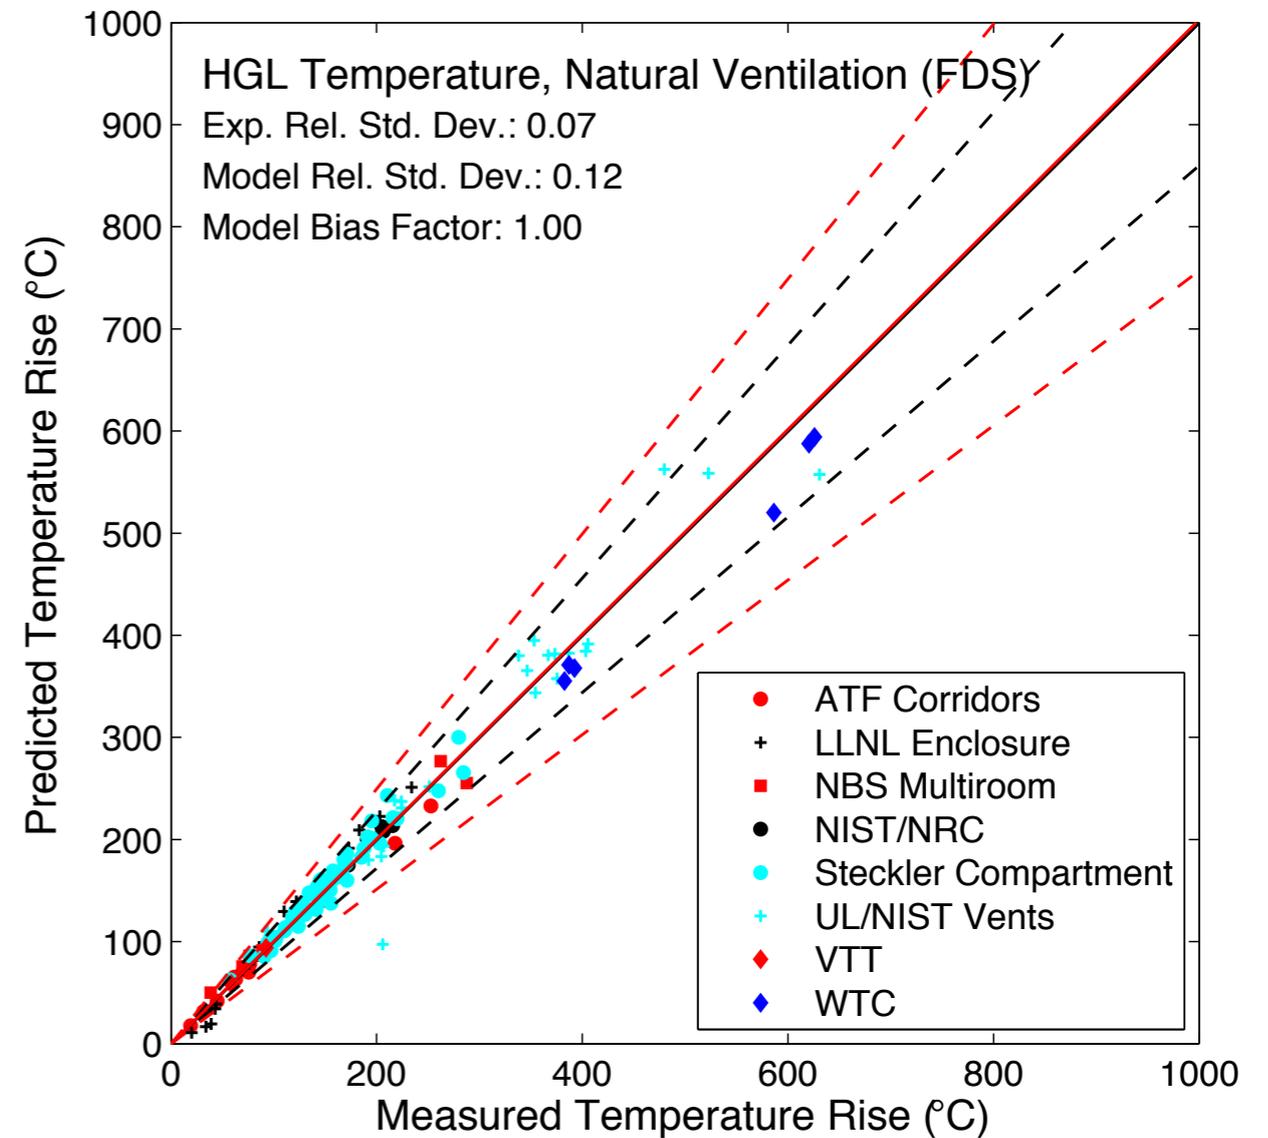

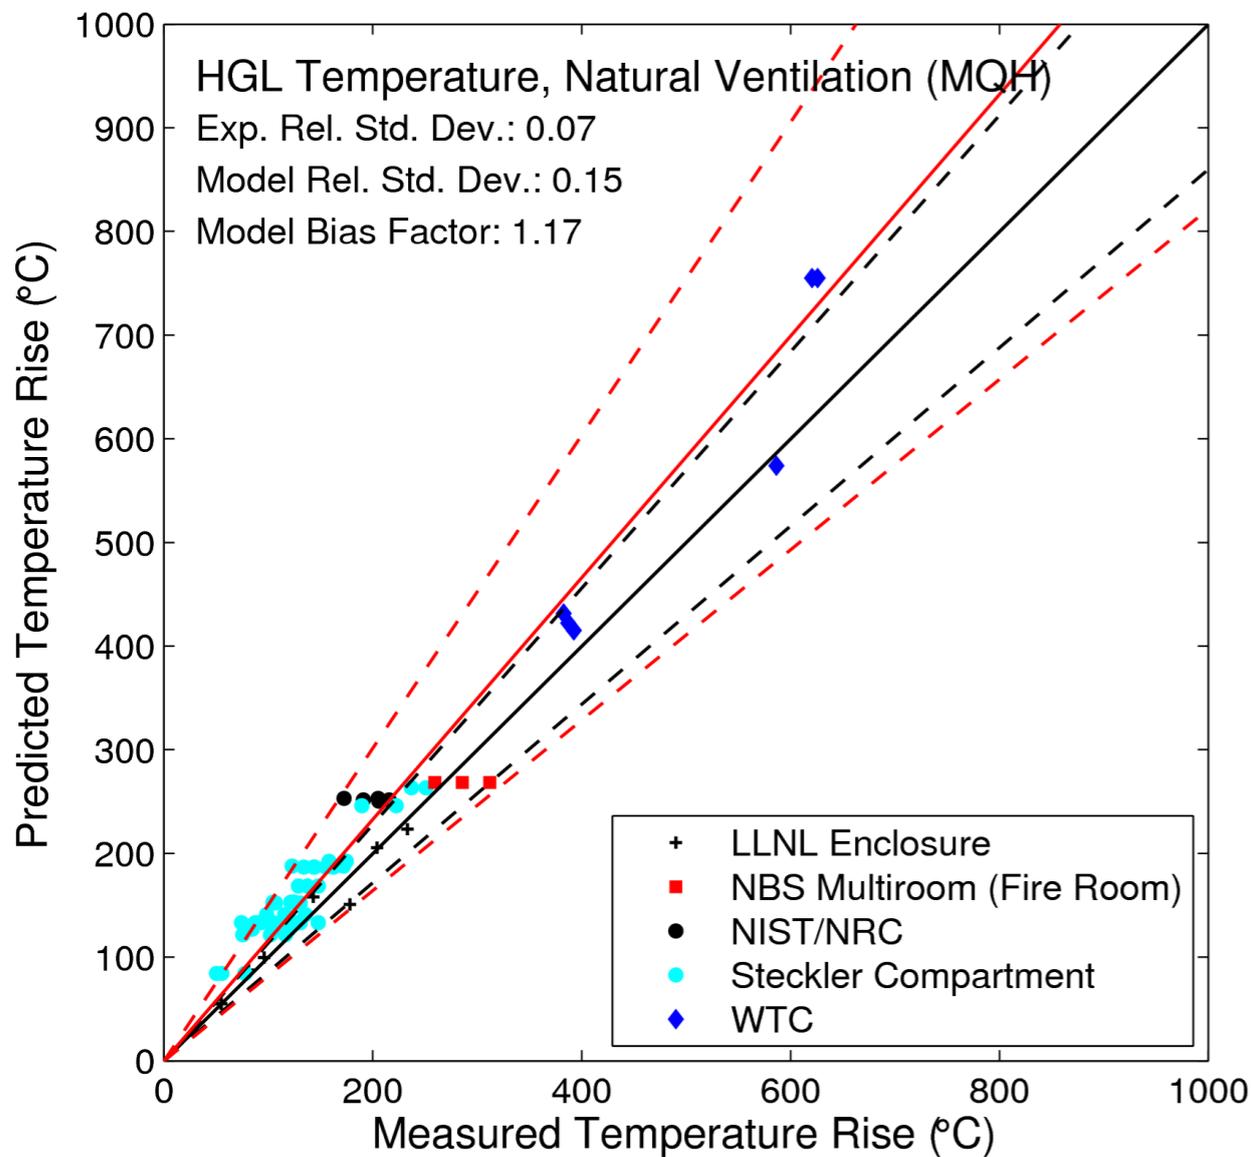

Can maintain empirical correlations in the long term in a centralized location. New empirical correlations and experimental data can be added, and the document can be regenerated in ~15 minutes from the FDS repository.

NUREG-1824 Supplement 1 includes the validation results of empirical correlations, zone models, and a CFD model.

14 output quantities were considered, including:

- Hot Gas Layer Temperature
- Ceiling Jet Temperature
- Target Heat Flux
- Target Temperature
- Sprinkler Activation Time
- Smoke Detector Activation Time
- [...]

Measured and predicted results are compared via scatter plots and summarized via two metrics: **model bias** and **uncertainty**.

# Summary of NRC NUREG-1824 Supplement 1

## Models of Interest

### Quantities of Interest

Output Quantity	Empirical Correlations			CFAST		MAGIC		FDS		Exp
	Corr.	$\delta$	$\sigma_M$	$\delta$	$\sigma_M$	$\delta$	$\sigma_M$	$\delta$	$\sigma_M$	$\sigma_E$

*Instruction on using SmartSVN to Connect to the FDS-SMV SVN repository.*

[Featured](#), [Phase-Deploy](#)

Updated Jan 22, 2014 by [shostikk](#)

## Introduction

[Google Code](#) uses [Subversion](#) (SVN) for version control. Subversion is widely considered as an improved versioning method over CVS. This Wiki page provides instructions on using a browser called *SmartSVN* or the command line to obtain files from the FDS-SMV SVN Repository.

## Using SVN via the Browser SmartSVN

[SmartSVN](#) is available as freeware. A for-purchase version of *SmartSVN* is available that has additional capabilities, but for most users the free version will suffice.

## Checking out the Repository via SVN ¶

### The First Time

- After installing *SmartSVN*, launch the program.
- The program will open with a *Welcome to SmartSVN* window. Select **Check out project from repository**.
- A *Check Out Repository* window will open.
- In the **Server Name** box, for anonymous checkout, type

```
http://fds-smv.googlecode.com/svn/trunk/FDS/trunk/
```

or if you have commit privileges, type

```
https://fds-smv.googlecode.com/svn/trunk/FDS/trunk/
```

- Click **Next**
- *SmartSVN* will scan the repository in display a directory tree.
- Click **Next**
- Click **No** to avoid checking out files up to the project root.
- Type in or browse to a **Local directory** where the files will be stored on your computer.
- Ensure that the **Check Out: Directly into the above directory** and **Check out recursively** options are selected.
- Click **Next**.
- Enter a name for the new project, e.g., **FDS-SMV**.
- Click **Finish** to check out the files to your machine.

At this point, the entire FDS-SMV project will be copied from the repository to your computer.

## ★ [Contribution\\_Guide](#)

*Guide on how to contribute to FDS-SMV development.*

Updated Feb 21, 2013 by [randy.modermott](#)

### How Can I Best Contribute to FDS?

Historically, FDS development has been the result of the efforts of a small number of people. With the move towards web based tools for version control and user support, it has become much easier for outside parties to have an opportunity to contribute to FDS. We, the developers, recognize that this path is a bit of a tightrope. We never had as much time and resources as we would like for development and user support, so the aid of the user community could be a great benefit. On the other side is the historical recognition that very few people and organizations are willing or able to work within the existing framework to make a long term concerted effort towards development. The result is incomplete algorithms which are not validated, too limited in their application, unworkable within the overall FDS framework, or unmaintainable by the core development team. As a result, these efforts never make their way into FDS. This is of course a frustration both to the developers and to the organization/individual that expended the effort. The goal of this document is to discuss ways in which interested users can make contributions to the development of FDS that are of lasting value.

### A Few Words on Open Source Development

Open source development can be a great thing. The concept of a worldwide pool of software developers working in tandem for the greater good is a noble one. There are hundreds of thousands of open source projects in existence; however, six months from now 99,999 of 100,000 projects will be for all purposes dead in the water. Why?

- Too few developers or not enough resources to bring the project to completion
- Interest in continued development and/or support following a release wanes
- Disagreements in the direction of the project result in splinter projects being created which dilute the development effort into nothingness

The successful, long lasting open source projects are few (Linux, Mozilla, and OpenOffice? are a few). They have been those with large enough user+developer bases to survive as project members come and go or have committed, long-term institutional support.

### What can I do to contribute?

#### User Support

If the posting logs of the Discussion Forum and the Issue Tracker are examined, you will find that only a few names represent the bulk of responses to user questions and bug fixes. A very valuable contribution would be for you to spend time on either. If you know the answer to a question on the forum, post a response. If you can compile FDS on your own and have a case that gives an error message, compile a debug version and attempt to locate at least the general source of the error before making an issue report. Time we don't spend on user support is time we have to spend doing development.

#### Documentation

This is an area where you can easily make meaningful contributions and in doing so free up time of the core developers. We attempt to write clear documentation in both the Theory Manual and in the User's Guide. However, we do not always explain well concepts that we consider "obvious". As a result documentation may not be as clear or complete as it should be. If you have struggled with some FDS concept or had to make multiple tries to get an input to work correctly, then help us by writing changes for that portion of the Theory Manual or User's Guide. A new LaTeX file is preferred, but even pasting text from the pdf file into a word processor and sending changes as, for example, a Word document would help us.

## Prerequisites

Before getting started, are you conversant in [Matlab](#) and [LaTeX](#)? No? Do yourself a favor: take a week out of your busy life and learn the basics of these tools. I guarantee your investment will payoff a thousand fold!

## Introduction

The purpose of this page is to document, through example, all of the minute steps required to get a verification case from conception to full automation, such that the FDS Verification Guide can be built without error by pressing a single button. Similar procedures also apply to the FDS Validation Guide. Here we will follow the development of the "heated channel" test case series developed by Kiyoung Moon of Yonsei University.

One difference between the verification suite and the validation suite is that the user is expected to run all the verification cases in order to compile the guide. That is, from a pristine download of the FDS code project, the output files necessary to generate the plots in the guide are not committed to the repository. For validation this is not the case. All necessary output files are committed and just need to be processed by the appropriate Matlab scripts.

The reader should take note of the files that need to be committed. In the text below, these files will be highlighted with a **(commit)** tag. The most common problem we encounter when compiling the guides is that an author will assume their case is fully committed because they are able to compile the guide on their machine, but if they have not committed all the necessary files the guide will not compile for the other project members.

Let's get started.

## Case Setup

For this particular test series Kiyoung wants to compare FDS results for the mean streamwise temperature profile in the wall-normal direction to the heated channel flow DNS calculations of Kim and Moin (1987). He will run four cases at different molecular Prandtl numbers (Pr). His goal is to verify the implementation of a new wall heat flux model.

# The FDS-SMV project embraces

- 1) Open-source development
- 2) Continuous integration
- 3) Software quality testing
- 4) Performance metrics
- 5) Parallel and high performance computing
- 6) Cross-platform compatibility
- 7) Contributions and participation from users and community

# Ways for users to contribute

- 1) Feature testing
- 2) Documentation
- 3) Participating in discussion group
- 4) Verification cases
- 5) Validation data sets
- 6) Bug reporting
- 7) Improving submodels
