

# Development R&D Review

Automated Grouping

Model Extraction from BIM Data

Unified Fire-Egress Visualization

# Recent Development Work

- PyroSim
  - Updated Simulator Support: FDS 5.5, 5.6, 5.7
  - Preview Support for FDS 7 Complex Geometry
  - AutoCAD 2018 File Import
  - Support for Complex Reactions
  - Combined Fire/Evac Results Viewer Application

# Recent Development Work

- Pathfinder
  - Assisted Evacuation
    - Vehicle Agents, Assistance Teams
    - Refuge Rooms
    - Maximum Room Capacities
  - Simulator Enhancements
    - Occupant Sources
    - Movement Groups
    - Optional Radius Reduction for Narrow Geometry (Stadium Seating)
    - Time-Based One-Way Doors
    - Door Wait Times
    - FED Calculation Improvements
    - Console Scripting – Multiple Randomized Runs (Monte Carlo)

# Recent Development Work

- Pathfinder (more)
  - Enhanced Behaviors
    - Wait-Until
    - Behavior Switching
  - Enhanced Profiles
    - Control of Stair/Elevator/Component Use
    - Profile Libraries
  - Elevator Improvements
    - Automatic Agent Use
    - Park Location and Call Distance
    - Double-Deck Elevators
  - User Interface
    - Re-randomize Occupant Location
    - Reduce Room Population

# Recent Development Work

- Bundled Results Viewer
  - Integrated Fire/Movement Visualization
  - Unified View/Section/Tour Specification
  - New 3D Occupant Models
  - Time Offset for Result Datasets
  - Improved Lighting
  - Hardware GPU Shaders
  - Dedicated GPU Priority
  - Preview Support for VR Headsets

# Technical Background

- Grouping in Pathfinder
- BIM-Based Auto Model Generation
- Unified Fire & Movement Visualization

# Movement Groups

- Introduced in Pathfinder 2018.1
- Implemented a Model of Group Movement
- Occupants with Common Goal
- Supports Automatic Group Creation
- Works with Large Crowds
- Presented at PED 2018 (Lund, Sweden)

# Group Movement Model

- Leader-Follower Movement Model
  - Leader (can be automatic)
  - Members
  - Maximum Connection Distance
  - Group Moves at Slowest Member Speed

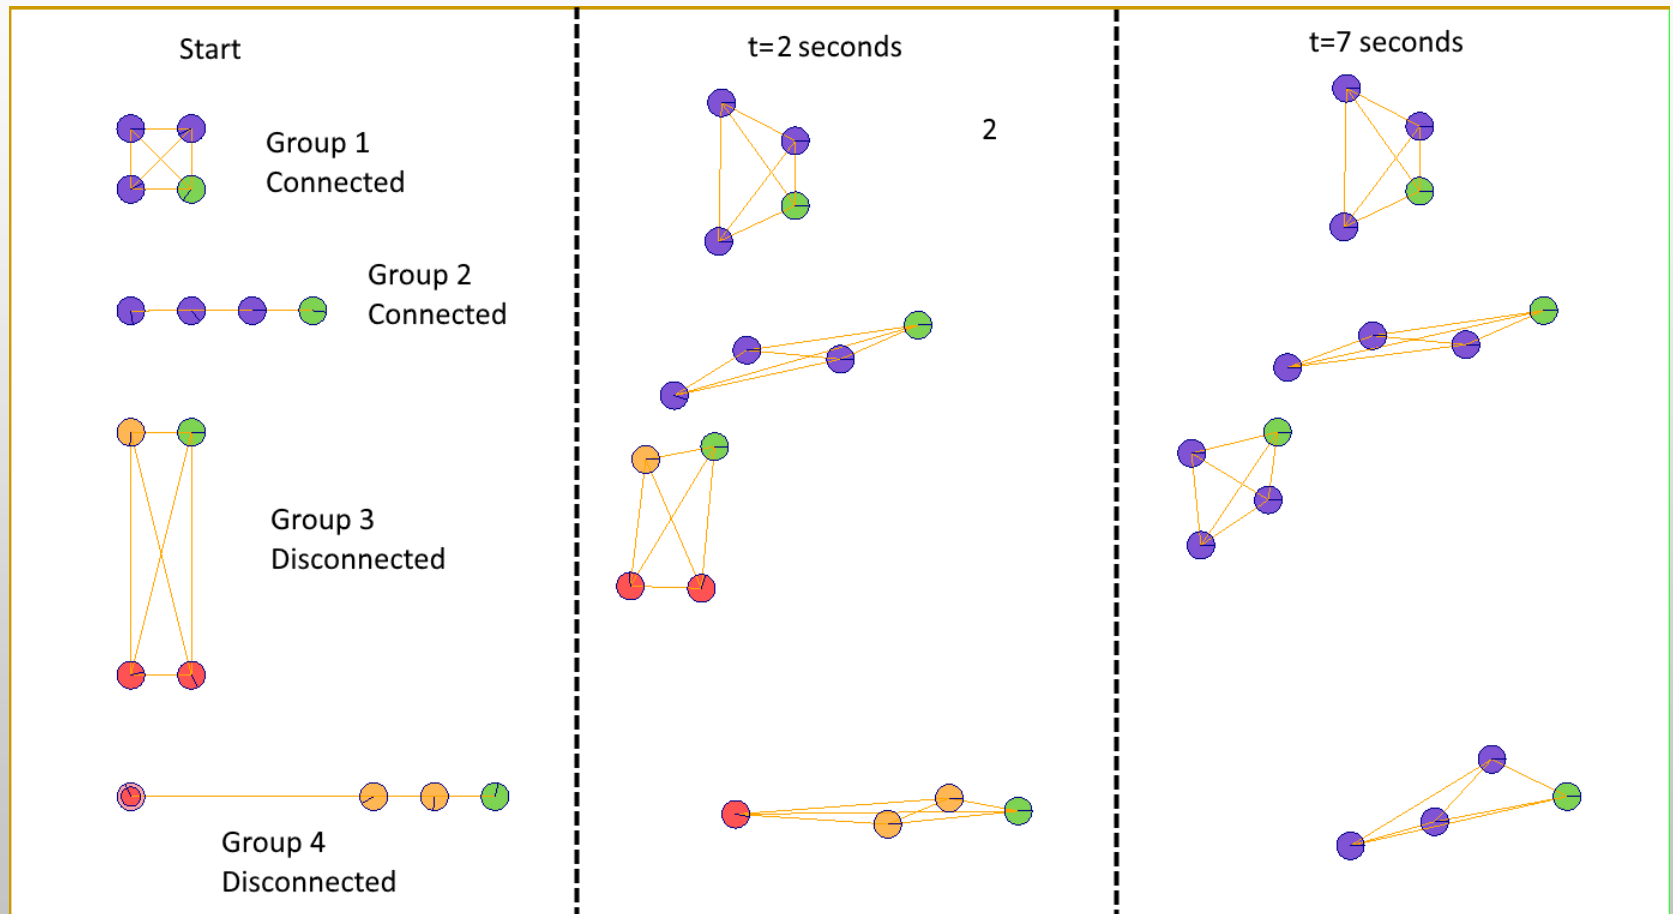

# Disconnected Groups

- Group is in *Disconnected* state when a member has exceeded the *Maximum Distance*
- Leader Identified if Automatic
  - Member closest to goal
- Leader Slows and Waits
  - *Slowdown Time* parameter controls Leader
  - Exception in Dense Crowds
- Seek Closest Connected Member
- Continue Movement at Slowest Speed after Connection

# Automatic Group Definition

- Based on K-means clustering data mining algorithm
- Data Points added to Clusters based on similarity
  - Data Points assigned to most similar cluster
  - Clusters adjusted to best fit assigned points
  - Iterate to until convergence
- Uses *same-size k-means* variant
  - Groups as clusters, Occupants as data points
  - Similarity measure is Euclidian or Travel Distance
  - Constrained by Room or Reachability

# Automatic Grouping

- Minimizes Mutual Group Distance
- Ensures Members Can Reach Each Other
- Group Membership Can Be Defined
  - Ex: 2 Adults, 2 Children
- Distribution of Groups Can Be Defined
- Fast Creation of Thousands of Groups

# Model Generation from BIM Data

- What is BIM?
- From Autodesk...

AEC / OVERVIEW INDUSTRIES ▾ CONTENT HUB

## What is BIM?

BIM (Building Information Modeling) is an intelligent 3D model-based process that gives architecture, engineering, and construction (AEC) professionals the insight and tools to more efficiently plan, design, construct, and manage buildings and infrastructure.

[→ Get started with BIM](#)

# What is BIM?

## Definition

The US National Building Information Model Standard Project Committee has the following definition:

Building Information Modeling (BIM) is a digital representation of physical and functional characteristics of a facility. A BIM is a shared knowledge resource for information about a facility forming a reliable basis for decisions during its life-cycle; defined as existing from earliest conception to demolition.[19]

**Essentially: BIM is a full, 3-dimensional, digital model of a building, including data and attributes – a building database.**

# Model Generation from BIM

- Previously, Used Flood-Fill Algorithm
  - Extract one large room
  - User must break apart and create doors
- From BIM
  - Import IFC File
  - Build Geometry Using BIM Object Types

# BIM Object Types

Object Type	Pathfinder Type
Slab Covering / FLOORING Transport Element / MOVINGWALKWAY	Room
Door	Door
Stair Transport Element / ESCALATOR	Stair

# General Extraction Method

1. Find all Walking Surfaces (slope < tol)
2. Find Obstructions and extrude / intersect / remove
3. Delete disconnected Walking Surfaces inside objects
4. Close small gaps
5. Delete small rooms
6. Generate Stairs
7. Generate Doors
8. Cleanup

# Generate Stairs

1. Identify Steps from Walking Surfaces
2. Project to find unobstructed, connected edges of Steps
3. For runs with equal rise/run, create Pathfinder Stair

# Generate Doors

1. Get geometry for imported Door objects
  - a. Wall Opening <or> Door Geometry
2. Obtain Door bounding box from geometry
3. Modify bounding box for door thickness
  - a. IFC local y-axis
  - b. Minimum door dimension
4. Subtract extruded geometry from Walking Surfaces
5. Connected resulting intersected edges with a Pathfinder Door

# Future Model Generation Work

- Automatic generation for non-BIM files
  - Can manually tag objects now
  - Automatically detect stairs, doors, etc.
- Support future BIM data for movement models
  - Occupancy information
  - Other movement metadata

Use imported names

**Walking Surface**

- Max slope: 45.0 °
- Max head height: 1.8 m
- Extract from tops of solids
- Exclude rooms in solids
- Close gaps smaller than: 0.15 m
- Exclude rooms with area less than: 0.0225 m²

**Components**

- Extract doors
- Extract stairs
- Max vertical step distance: 0.4 m
- Max horizontal step distance: 0.1 m
- Min stair width: 0.5 m

NOTE: Rooms are extracted from imported objects that have object type **Slab**, **Ramp**, **Ramp Flight**, or floor coverings.  
Stairs are extracted from **Stair** and **Stair Flight**.  
Doors are extracted from **Door**.  
Obstructions are all types except **Door**.

# Unified Visualization

- Technical Objectives
  - Integrated Fire and Movement Results
  - Support for Large Datasets
  - Support all FDS Output Types
  - Smooth, High-Framerate Rendering
  - VR Capability

# Data Optimization

- File Streaming
  - File is scanned, but only selected frames are loaded into memory as needed for rendering
  - Data file size effectively unlimited
  - Limiting factor is size of a few frames of data
  - Supports fast load and seek-to
  - Data loaded asynchronously

# Visualization Features

- Time Interpolation for Most Data
  - Smoother rendering when display rate exceeds data interval
- Spatial Interpolation for Plot3D/3D Slice Data
- Volumetric Rendering for 3D Data
- General Surfaces and Slices for 3D Data
- Occupant Data Contours
- Views/Sections/Tours
- Easy Movie Creation

# Rendering Performance

- GPU Shaders for Geometry
  - Improved Lighting Quality
  - Up to 10x Improvement
- Optimized Fire/Smoke Rendering
  - New Ray-Marching Visualization Algorithm
  - Traditional Algorithm Implemented using 3D Texture
  - Stacked Slice Method Maintained for Max Compatibility
- Leverage GPU
- Parallel Processing to Utilize CPU (Interpolation, Isosurfaces)
